Make the Button Text Dynamic

First, add a line of markup to the HTML file we were working on earlier, app/views/sessions/new.html.erb, setting the data-bridge-title attribute. Remember, Rails will convert the underscores in this hash to dashes.

ch07_13/rails/app/views/sessions/new.html.erb

```
<% content_for :title, "Sign in" %>

<div class="container d-flex flex-column mw-400 mx-auto">
  <h1 class="h3 d-hotwire-native-none my-4 mx-auto">
    Sign in to your account
  </h1>

  <%= form_with url: session_path, class: "row g-3 mt-1" do |form| %>
    <%# ... %>

    <div>
      <%= form.submit "Sign in", class: "btn btn-primary w-100", data: {
        controller: "bridge--button",
»       bridge_title: "Sign in"
      } %>
    </div>
  <% end %>
</div>
```

Remember the BridgeElement that we *clicked* before? We can call bridgeElement.title to grab the value of data-bridge-title set in the HTML.

Open button_controller.js and pass the title in the second parameter of send(). I'm using JavaScript's shorthand property names to create this object: {title: title}.

ch07_13/rails/app/javascript/controllers/bridge/button_controller.js

```
import { BridgeComponent } from "@hotwired/hotwire-native-bridge"

export default class extends BridgeComponent {
  static component = "button"
```
