Run the app again and visit the Sign in page. The native button title will still read “Sign in,” but this time it’s coming from the HTML instead of being hardcoded in Swift.

Prove this by changing the value of `data-bridge-title` in `app/views/sessions/new.html.erb`. Dismiss the modal and visit the Sign in page again—the new button title will appear, all without even rerunning the native app.

Looking good! Well, except for the fact that there are now *two* buttons to sign in: a native one in the upper right and the big blue HTML one at the bottom.

Hide the HTML Button

We can hide the HTML button with some custom, albeit complicated-looking, CSS. Add the following to the end of the native CSS file, `app/assets/stylesheets/native.css`:

ch07_16/rails/app/assets/stylesheets/native.css

```
.d-hotwire-native-none {
  display: none !important;
}

.d-hotwire-native-block {
  display: block !important;
}
```
