Now, copy the code to your machine and navigate to the `ch01_00` directory. Create and seed the database by switching to the `rails` directory and running `bin/setup` on the command line.

ActiveRecord::AssociationTypeMismatch

If running `bin/setup` raises an `ActiveRecord::AssociationTypeMismatch` exception, try running the seeds manually via `bin/rails db:seed`. There's an inconsistency with SQLite https://github.com/rails/rails/issues/53832 that's currently being addressed.

Then, start the server via `bin/dev` and visit `http://localhost:3000` to check out what we're working with. The app is a basic CRUD application to keep track of our nature hikes with some basic styling from Bootstrap.[14] Users can create, read, update, and delete entries, as well as upload an image from their trek.
