Practice this by making the “Add a hike” button a native one. Add the `data` markup to `app/views/hikes/index.html.erb`:

ch07_17/rails/app/views/hikes/index.html.erb

```
    <%= render "shared/header", title: "Hikes" %>
    <%# ... %>

    <div class="container d-flex justify-content-between gap-2 mt-4">
      <% if user_signed_in? %>
        <%= link_to "Add a hike", new_hike_path,
»         class: "btn btn-primary flex-grow-1 flex-sm-grow-0", data: {
»           controller: "bridge--button",
»           bridge_title: "Add"
          } %>
        <%# ... %>
      <% else %>
        <%# ... %>
      <% end %>
    </div>
```

Run the app, sign in, and notice the native Add button in the upper right.

You just added a new, native button without a single line of native code. Ah, the magic of bridge components.

Text buttons work pretty well. But sometimes a simple, easily recognizable icon can level up the design. Next, we’ll add an *image* to the bridge
