```
      super.connect()

      const title = this.bridgeElement.bridgeAttribute("title")
»     const imageName = this.bridgeElement.bridgeAttribute("image-name")
»     this.send("connect", {title, imageName}, () => {
        this.bridgeElement.click()
      })
    }
  }
```

We're now sending a second JSON field, `imageName`, to the iOS app. To use this, we'll need to add a property in the Swift `struct` at the bottom of the file. Then we can pass it to the `UIAction` to set the image.

ch07_18/ios/App/Components/ButtonComponent.swift

```
import HotwireNative
import UIKit

class ButtonComponent: BridgeComponent {
    override class var name: String { "button" }

    override func onReceive(message: Message) {
        guard let data: MessageData = message.data() else { return }

        let action = UIAction(title: data.title) { _ in
            self.reply(to: message.event)
        }
        let button = UIBarButtonItem(primaryAction: action)

»       if let imageName = data.imageName {
»           button.image = UIImage(systemName: imageName)
»       }

        let viewController = delegate?.destination as? UIViewController
        viewController?.navigationItem.rightBarButtonItem = button
    }
}

private extension ButtonComponent {
    struct MessageData: Decodable {
        let title: String
```
