

Adding the edit icon (the pencil) to the hikes show page is a great example of how powerful bridge components are. This component should only appear when the user is signed in. And we can keep *all* of that logic on the server. Right now, it's embedded in the `if user_signed_in?` call in the `app/views/hikes/index.html.erb` template.

The native app code doesn't care if the user is signed in or not. If it receives the `connect()` message, it adds the component; that's all it needs to know. It doesn't need to perform any authentication checks or keep track of the authentication state; it simply waits for a message.

But there's a subtle bug. Can you find it?

Run the app, sign in, then sign back out. The native component is still there. And tapping it doesn't do anything.
