```
    connect() {
      // ...
    }

»   disconnect() {
»     super.disconnect()
»
»     this.send("disconnect")
»   }
  }
```

Back in `ButtonComponent` in Xcode, move the contents of `onReceive(message:)` to a new private function named `connect(via:)`. Then, call this function only if the `Message` `event` is “connect”.

ch07_21/ios/App/Components/ButtonComponent.swift

```
  import HotwireNative
  import UIKit

  class ButtonComponent: BridgeComponent {
      override class var name: String { "button" }

      override func onReceive(message: Message) {
»         if message.event == "connect" {
»             connect(via: message)
»         }
      }

»     private func connect(via message: Message) {
          guard let data: MessageData = message.data() else { return }

          // ...
      }
  }

  // ...
```
