Finally, add another private function called `disconnect()` that removes the button when the `Message event` is “disconnect”.

ch07_22/ios/App/Components/ButtonComponent.swift

```
    import HotwireNative
    import UIKit

    class ButtonComponent: BridgeComponent {
        override class var name: String { "button" }

        override func onReceive(message: Message) {
            if message.event == "connect" {
                connect(via: message)
»           } else if message.event == "disconnect" {
»               disconnect()
            }
        }

        private func connect(via message: Message) {
            // ...
        }

»       private func disconnect() {
»           let viewController = delegate?.destination as? UIViewController
»           viewController?.navigationItem.rightBarButtonItem = nil
»       }
    }

    // ...
```

Now, signing out will correctly remove the component.

I find myself often following these same steps when working with the native navigation bar. Cleaning up after ourselves is always a good idea. And here, we’re preventing a subtle, but important, bug.
