provides you with the convenient `toolbarForNavigation()`, referencing the existing toolbar (provided by Hotwire Native) at the top of the screen.

ch08_06/android/app/src/main/java/com/masilotti/hikingjournal/components/ButtonComponent.kt

```
    // ...

    class ButtonComponent(
        name: String,
        private val bridgeDelegate: BridgeDelegate<HotwireDestination>
    ) : BridgeComponent<HotwireDestination>(name, bridgeDelegate) {
        private val fragment: HotwireFragment
            get() = bridgeDelegate.destination.fragment as HotwireFragment

        override fun onReceive(message: Message) {
            val composeView = ComposeView(fragment.requireContext()).apply {
                // ...
            }

»           val toolbar = fragment.toolbarForNavigation()
»           toolbar?.addView(composeView)
        }
    }
```

This is a good spot to stop and check your work, so go ahead and run the app. If you're not signed in, tap the Sign in button at the bottom of the screen. You'll then see the native Sign in button (yay!). But it's pushed all the way to the left (boo!).
