Build a Hotwire Native iOS App

To build your first Hotwire Native app on iOS, you'll follow three steps: create a new Xcode project, add the Hotwire Native package, and configure the app to get it running. Are you ready to write your first line of Swift?

Create a New Xcode Project

Start by creating a new project by opening Xcode and clicking Create New Project… in the welcome window. Or, click File → New → New Project….

Select iOS at the top and then App from the Application section. Click Next.
