corresponding JavaScript code to click the web-based button.

Go ahead and run the app and click Sign in. You'll see a big purple button in the upper right.

But there's an odd bug. Dismiss the sign-in screen by tapping the X in the upper left. Then, tap Sign in again. Now, there are multiple buttons, as shown in the screenshot.

Every time you visit a page with this bridge component, a *new* button is added to the screen. On iOS, you *set* the button via `rightBarButtonItem =`, so you didn't have this problem. But on Android, `toolbar?.addView()` adds a new one each time the screen loads. Let's fix that before moving on.
