Remove Duplicate Buttons

Start by moving everything inside of `onReceive(message: Message)` to a new private function named `addButton(message: Message)`.

ch08_09/android/app/src/main/java/com/masilotti/hikingjournal/components/ButtonComponent.kt

```
    // ...

    class ButtonComponent(
        name: String,
        private val bridgeDelegate: BridgeDelegate<HotwireDestination>
    ) : BridgeComponent<HotwireDestination>(name, bridgeDelegate) {
        private val fragment: HotwireFragment
            get() = bridgeDelegate.destination.fragment as HotwireFragment

        override fun onReceive(message: Message) {
»           addButton(message)
        }

»       private fun addButton(message: Message) {
            val composeView = ComposeView(fragment.requireContext()).apply {
                // ...
            }
            // ...
        }
    }
```

Then, set an `id` on the button. The value itself is arbitrary; it could be anything. You just need a reference for finding it later. Here, I've set the value to 1.

ch08_10/android/app/src/main/java/com/masilotti/hikingjournal/components/ButtonComponent.kt

```
    // ...

    class ButtonComponent(
        name: String,
```
