```
        private fun addButton(message: Message) {
            // ...
        }

»       private fun removeButton() {
»           val toolbar = fragment.toolbarForNavigation()
»           val button = toolbar?.findViewById<ComposeView>(buttonId)
»           toolbar?.removeView(button)
»       }
    }
```

Back in `onReceive(message: Message)`, only add the button when the event name is “connect” and remove it on “disconnect”. Also, remove it before adding it (again) just in case there’s already one there. This ensures the button gets removed every time the screen disappears, mimicking the pattern you built on iOS.

ch08_12/android/app/src/main/java/com/masilotti/hikingjournal/components/ButtonComponent.kt

```
    // ...

    class ButtonComponent(
        name: String,
        private val bridgeDelegate: BridgeDelegate<HotwireDestination>
    ) : BridgeComponent<HotwireDestination>(name, bridgeDelegate) {
        private val buttonId = 1
        private val fragment: HotwireFragment
            get() = bridgeDelegate.destination.fragment as HotwireFragment

        override fun onReceive(message: Message) {
»           if (message.event == "connect") {
»               removeButton()
»               addButton(message)
»           } else if (message.event == "disconnect") {
»               removeButton()
»           }
        }

        // ...
    }
```
