Make the Button Text Dynamic

The title of the button is coming in via JSON from the bridge component on the web. And to parse JSON on Android, you need to configure a serialization library.[48]

Start by adding the library to the module's `build.gradle.kts`—once to the `plugins` section and again at the bottom to the `dependencies` section.

ch08_15/android/app/build.gradle.kts

```
    plugins {
        alias(libs.plugins.android.application)
        alias(libs.plugins.kotlin.android)
        alias(libs.plugins.compose.compiler)
        id("com.google.android.libraries.mapsplatform.secrets-gradle-plugin")
»       id("org.jetbrains.kotlin.plugin.serialization")
    }

    // ...

    dependencies {
        // ...
        implementation("androidx.compose.ui:ui-tooling-preview")
        implementation("com.google.maps.android:maps-compose:6.1.0")
»       implementation("org.jetbrains.kotlinx:kotlinx-serialization-json:1.8.1")
        debugImplementation("androidx.compose.ui:ui-tooling")
        testImplementation(libs.junit)
        androidTestImplementation(libs.androidx.junit)
        androidTestImplementation(libs.androidx.espresso.core)
    }
```

Then, add the plugin to the top-level `build.gradle.kts` file and sync Gradle.

ch08_15/android/build.gradle.kts

```
    // Top-level build file where you can add configuration options common to all
    // sub-projects/modules.
    plugins {
```
