```
        alias(libs.plugins.android.application) apply false
        alias(libs.plugins.kotlin.android) apply false
        alias(libs.plugins.compose.compiler) apply false
»       id("org.jetbrains.kotlin.plugin.serialization") version "2.0.0" apply
    false
    }

    buildscript {
        dependencies {
            classpath(
                "com.google.android.libraries.mapsplatform" +
                        ".secrets-gradle-plugin:secrets-gradle-plugin:2.0.1"
            )
        }
    }
```

Finally, tell Hotwire Native which library you're using by setting `jsonConverter` in `HikingJournalApplication`.

ch08_15/android/app/src/main/java/com/masilotti/hikingjournal/HikingJournalApplication.kt

```
    // ...
    import com.masilotti.hikingjournal.fragments.MapFragment
    import dev.hotwire.core.bridge.BridgeComponentFactory
»   import dev.hotwire.core.bridge.KotlinXJsonConverter
    import dev.hotwire.core.config.Hotwire
    import dev.hotwire.core.turbo.config.PathConfiguration
    // ...

    class HikingJournalApplication : Application() {
        override fun onCreate() {
            // ...

            Hotwire.registerBridgeComponents(
                BridgeComponentFactory("button", ::ButtonComponent)
            )

»           Hotwire.config.jsonConverter = KotlinXJsonConverter()
        }
    }
```
