kept `imageName` the same (you only *added* `iconName`), you don't need to go back and update the native iOS code.

Apply these changes to the HTML by opening the hikes index page and adding the new data attribute for the Android icon.

ch08_18/rails/app/views/hikes/index.html.erb

```
    <%# ... %>

    <div class="container d-flex justify-content-between gap-2 mt-4">
      <% if user_signed_in? %>
        <%= link_to "Add a hike", new_hike_path,
          class: "btn btn-primary flex-grow-1 flex-sm-grow-0", data: {
            controller: "bridge--button",
            bridge_title: "Add",
            bridge_ios_image_name: "plus",
»           bridge_android_icon_name: "add"
          } %>
        <%# ... %>
      <% else %>
        <%# ... %>
      <% end %>
    </div>
```

And do the same on the hikes show page.

ch08_18/rails/app/views/hikes/show.html.erb

```
    <%= render "shared/header", title: @hike.name %>

    <div class="container">
      <%# ... %>

      <div class="d-flex align-items-center mt-3">
        <%= render "likes/like", hike: @hike, like: @like %>

        <div class="d-flex gap-2 ms-auto">
          <%# ... %>

          <% if user_signed_in? && @hike.user == current_user %>
            <%= link_to edit_hike_path(@hike), class: "btn btn-outline-primary",
```
