Add a second property to `MessageData` to parse "iconName" as a `String`. Then, add a new parameter to `ToolbarButton()` to pass in this value. Don't forget to update the calling code in `addButton()`, too.

ch08_19/android/app/src/main/java/com/masilotti/hikingjournal/components/ButtonComponent.kt

```
    // ...

    class ButtonComponent(
        name: String,
        private val bridgeDelegate: BridgeDelegate<HotwireDestination>
    ) : BridgeComponent<HotwireDestination>(name, bridgeDelegate) {
        // ...
        private fun addButton(message: Message) {
            val data = message.data<MessageData>() ?: return

            val composeView = ComposeView(fragment.requireContext()).apply {
                id = buttonId
                setContent {
                    ToolbarButton(
                        title = data.title,
»                       iconName = data.iconName,
                        onClick = { replyTo(message.event) }
                    )
                }
            }
            // ...
        }

        // ...
    }

    @Composable
»   private fun ToolbarButton(
»       title: String,
»       iconName: String?,
»       onClick: () -> Unit
»   ) {
        // ...
    }
```
