

When we first created the Xcode project in Chapter 1, *Build Your First Hotwire Native Apps*, we set an organization identifier of "com.masilotti" and an app name of "HikingJournal." Xcode used this to generate our bundle identifier of "com.masilotti.HikingJournal". If you changed your bundle identifier via the field shown in the screenshot, then make sure to reflect that in the Bundle ID field in the web form before continuing.

With your identifier in hand, you can configure the app on App Store Connect.
