Archive and Upload a Build

Back in Xcode, click Product → Archive from the Menu Bar. This creates a binary with the metadata of your code that you can upload to App Store Connect.

After a few moments, Xcode will let you know that the build failed with the following error message:

> Signing for “HikingJournal” requires a development team. Select a development team in the Signing & Capabilities editor.

For Apple to verify this archive is indeed your code, you need to sign the build. Think of this as a signed commit on GitHub—an extra layer of security to protect your codebase.

Click the HikingJournal project from the Project Navigator on the left, select HikingJournal from TARGETS (not PROJECT) in the middle column, and then select the Signing & Capabilities tab at the top.

If you haven’t signed in to your account in Xcode yet, you’ll see a button titled Add Account…. Click that and sign in with your Apple Developer account, as shown in the first screenshot.
