

I've included an example app icon along with the book's source code. Navigate to the `assets` directory next to the chapter checkpoints. Inside, you will find `AppIcon.png`. Click and drag that file over the dotted outline in Xcode to apply the image. Xcode will automatically copy it to the correct location and bundle it with your app.

Upload a new build with the app icon by archiving the app, selecting it from the Organizer, and clicking Distribute App. Success!

Once the build uploads, it needs to process before you can distribute it. Check its progress by clicking the little gray arrow or by visiting App Store Connect.[59] Builds show up in the TestFlight tab after selecting the app.
