Speed Up Future Builds

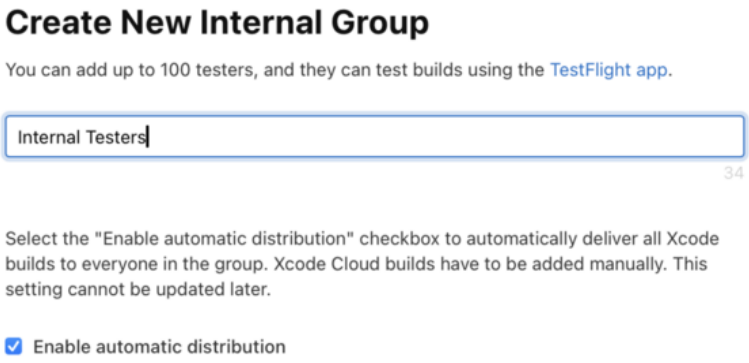

You'll need to manually select this encryption option from App Store Connect for every build you upload. You can speed up future builds by adding `<key>ITSAppUsesNonExemptEncryption</key> <false/>` to `Info.plist` under the `Resources` folder in Xcode. More information can be found from the Learn More[60] link in the dialog above.

The build is ready. Next, you need to tell App Store Connect who to distribute it to.

Create an Internal Testing Group

From the left column, click the blue plus sign next to INTERNAL TESTING.

Name this group "Internal Testers" and make sure the "Enable automatic distribution" option is checked. This ensures that every time a build uploads, each tester in the group gets a notification to download the latest release. Click Create.

You can only have up to 100 internal testers,[61] but builds distributed to these folks do *not* have to go through manual review from Apple. So, you are free to upload often and create a quick feedback cycle. If you want to distribute to more than 100 testers, then check out external testing.[62]
