```
    }

    // ...
```

Next, you'll set the `BASE_URL` build config field for each variant. As a quick refresher, you can get your macOS IP address by running `networksetup -getinfo Wi-Fi` in your terminal. Here, mine is `192.168.50.139`.

```
~ networksetup -getinfo Wi-Fi
DHCP Configuration
IP address: 192.168.50.139
Subnet mask: 255.255.224.0
Router: 192.168.128.1
Client ID:
IPv6: Automatic
IPv6 IP address: none
IPv6 Router: none
Wi-Fi ID: 5c:e9:1e:6b:08:f4
```

Add the build config field for both variants, pointing the debug variant to the original IP address and the release variant with your Mac's IP address.

ch09_06/android/app/build.gradle.kts

```
    // ...

    android {
        // ...

        buildTypes {
            debug {
»               buildConfigField(
»                   type ="String",
»                   name = "BASE_URL",
»                   value = "\"http://10.0.2.2:3000\""
»               )
            }

            release {
»               buildConfigField(
»                   type ="String",
»                   name = "BASE_URL",
```
