```
  package com.masilotti.hikingjournal.activities

  import android.os.Bundle
  import android.view.View
  import androidx.activity.enableEdgeToEdge
  import com.google.android.material.bottomnavigation.BottomNavigationView
» import com.masilotti.hikingjournal.BuildConfig
  import com.masilotti.hikingjournal.R
  import com.masilotti.hikingjournal.activities.models.mainTabs
  import dev.hotwire.navigation.activities.HotwireActivity
  import dev.hotwire.navigation.tabs.HotwireBottomNavigationController
  import dev.hotwire.navigation.tabs.navigatorConfigurations
  import dev.hotwire.navigation.util.applyDefaultImeWindowInsets

» const val baseURL = BuildConfig.BASE_URL

  class MainActivity : HotwireActivity() {
      // ...
  }
```

Next, you'll generate a signed app bundle to upload to Google Play. You'll select the release build variant, which will set the `baseURL` to our Mac's IP address.

Generate a Signed App Bundle

Select Build → Generate Signed App Bundle / APK… from the Menu Bar. Select Android App Bundle and click Next.
