

Hotwire Native and Future Updates

Hotwire Native is introducing breaking changes in *minor* version updates, for example, from v1.2 to v1.3. We selected "Up to Next Minor Version" in the Swift Package Manager dialog because this approach is slightly different than the official semantic versioning[16] guidelines.

Xcode will add a new section to your *Project Navigator*, the currently open navigator on the left, titled Package Dependencies. The Hotwire package will appear beneath that. We're free to dig into the code here, just as if we typed `bundle open` in a Rails app.
