Chapter 10

Send Push Notifications with APNs and FCM

One of the biggest selling points of a native mobile app is push notifications. Sometimes, it's *the* reason my clients need an app over a website. This is because push notifications are instant, reliable, and drive higher engagement than email or SMS. And even with recent enhancements to Progressive Web Apps (PWAs), native apps are still the best way to send reliable, timely notifications.

In this chapter, you'll learn how to configure, register, and send a push notification to iOS devices (via Apple Push Notification service (APNs)) and Android devices (via Firebase Cloud Messaging (FCM)). Specifically, whenever a user of your app likes a hike (by tapping the heart on a hike page), you'll use a push notification to let the owner of the hike know. This is what the user will see:
