```
    required_param :hike

    deliver_by :ios do |config|
      # ...
      config.format = ->(apn) {
        # ...
      }

»     credentials = Rails.application.credentials.ios
»     config.bundle_identifier = credentials.bundle_identifier
»     config.key_id = credentials.key_id
»     config.team_id = credentials.team_id
»     config.apns_key = credentials.apns_key
    end
  end
```

Wrap up this file by setting the development, or sandbox, environment flag. This allows you to send notifications to apps built in debug mode, such as when running from Xcode on the simulator. When you deploy to a staging or production server, `Rails.env.local?` will return `false`, setting the APNs environment to production.

ch10_20/rails/app/notifiers/new_like_notifier.rb

```
  class NewLikeNotifier < ApplicationNotifier
    required_param :hike

    deliver_by :ios do |config|
      # ...

      credentials = Rails.application.credentials.ios
      config.bundle_identifier = credentials.bundle_identifier
      config.key_id = credentials.key_id
      config.team_id = credentials.team_id
      config.apns_key = credentials.apns_key

»     config.development = Rails.env.local?
    end
  end
```
