Wrap up your Rails code changes by triggering the notification in `likes_controller.rb` when a new `Like` is created.

ch10_21/rails/app/controllers/likes_controller.rb

```
  class LikesController < ApplicationController
    before_action :authenticate_user!

    def create
      hike = Hike.find(params[:hike_id])
      hike.likes.find_or_create_by!(user: current_user)
»     NewLikeNotifier.with(hike: hike).deliver(hike.user)
      redirect_to hike
    end

    def destroy
      # ...
    end
  end
```

Alright, all that's left is populating those credentials. Let's do that now.

## Authenticate APNs

Wrap up the server code by authenticating the requests to APNs.

Sign in to your Apple Developer account[81] and click Keys from the Certificates, IDs & Profiles column in the middle.

Then, click the blue plus button at the top or Create a key. Enter a descriptive name for the name of the key and check the box next to Apple Push Notifications service (APNs). Click Continue. On the next screen, click Register.
