ch10_35/ios/App/Delegates/AppDelegate.swift

```
    // ...

    @main
    class AppDelegate: UIResponder, UIApplicationDelegate {
        // ...

        func application(
            _ application: UIApplication,
            didRegisterForRemoteNotificationsWithDeviceToken deviceToken: Data
        ) {
»           let token = deviceToken.map { String(format: "%02x", $0) }.joined()
»           Task { await viewModel.register(token) }
        }

        // ...
    }
```

With that, we have all the Swift code we need to register notification tokens with our Rails server. Go ahead and run the app. When you sign in, you should see the system prompt requesting permission to send push notifications.

But, when you tap Allow, you won't see the expected network request hitting the server. Check out the message in the Debug Area at the bottom of the screen. (You can toggle it with View → Debug Area → Show Debug Area.)
