

Run the app and watch your server logs. You should see a POST request hit `/notification_tokens` after signing in. To verify, open a Rails console and inspect the `NotificationToken` records.

Let's test the entire flow. First, run the app from Xcode and sign in. Then, in the *Simulator* app (not Xcode), select the Device → Lock menu item. In your machine's browser, navigate to the Forest Park hike and click the heart next to the like count—watch as the iOS app receives a push notification in the simulator!
