UNUserNotificationCenterDelegate protocol.

ch10_37/ios/App/Models/NotificationRouter.swift

```
import HotwireNative
import UserNotifications

class NotificationRouter: NSObject, UNUserNotificationCenterDelegate {
}
```

The UNUserNotificationCenterDelegate protocol provides a few hooks for us to configure how notifications are received and displayed. Check out the documentation[84] for some use cases.

When a notification is received, userNotificationCenter(_:didReceive:) is called. Declare this function now.

ch10_39/ios/App/Models/NotificationRouter.swift

```
import HotwireNative
import UserNotifications

class NotificationRouter: NSObject, UNUserNotificationCenterDelegate {
    @MainActor
    func userNotificationCenter(
        _ center: UNUserNotificationCenter,
        didReceive response: UNNotificationResponse
    ) async {
    }
}
```

To deep link the user to the relevant hike, you need to know what URL to load. You're already including the hike's URL path in each notification—in NewLikeNotifier you set it via custom_payload. You can retrieve this information by digging into the UNNotificationResponse parameter and pulling out userInfo. It's an untyped dictionary, so you have to cast the values before using them.

ch10_40/ios/App/Models/NotificationRouter.swift

```
import HotwireNative
```
