Configure Android for Push Notifications

We'll use Firebase Cloud Messaging[85] (FCM) to send notifications to Android devices.

To configure Android for push notifications, our path will mirror what we did previously:

1. Send FCM notifications from the Rails server.
2. Authenticate our server with FCM.
3. Add FCM dependencies to the Android app.
4. Authorize sending notifications.
5. POST Firebase token to `/notification_tokens`.
6. Route the notification.

Send FCM Notifications

We'll start by updating our Rails code with a new gem to interact with FCM. Then, we'll add a new `deliver_by` method to `NewLikeNotifier`.

Under the hood, Noticed uses the Google Auth Library for Ruby[86] gem to send notifications via FCM. Add this gem by switching to the `rails` directory and running `bundle add googleauth`.

Then, add a new option for FCM to the `platform` validation in `NotificationToken`. We'll identify notification tokens coming from the Android apps with this value.

ch10_46/rails/app/models/notification_token.rb

```
  class NotificationToken < ApplicationRecord
    belongs_to :user

    validates :token, presence: true
»   validates :platform, inclusion: {in: %w[iOS FCM]}
  end
```
