Open `NewLikeNotifier` and add a new `deliver_by` method for FCM. Whenever we send a notification, the notifier will run each of the delivery methods.

ch10_47/rails/app/notifiers/new_like_notifier.rb

```
    class NewLikeNotifier < ApplicationNotifier
      required_param :hike

      deliver_by :ios do |config|
        # ...
      end

»     deliver_by :fcm do |config|
»     end
    end
```

To make sure we only send notifications to folks who have an FCM token, gather the tokens of the `recipient`.

ch10_48/rails/app/notifiers/new_like_notifier.rb

```
    class NewLikeNotifier < ApplicationNotifier
      # ...

      deliver_by :fcm do |config|
»       config.device_tokens = -> {
»         recipient.notification_tokens.where(platform: :FCM).pluck(:token)
»       }
      end
    end
```

Next, format the payload of the notification via `config.json`. This should look pretty similar to what we did for APNs notifications earlier (especially the `path` option to deep link to later).

ch10_49/rails/app/notifiers/new_like_notifier.rb

```
    class NewLikeNotifier < ApplicationNotifier
      # ...

      deliver_by :fcm do |config|
```
