

Register the app with a bundle identifier. I'm using `com.masilotti.hikingjournal`—make sure to change yours to reflect your app. Then click Register app.

On the next screen, click Next—we'll download this file later when we configure the Android app. Click Continue to Console.

We'll authorize our Rails app with a Firebase service account key. At the top of the Project settings screen, select the Service accounts tab. Then, click "Generate new private key". Don't worry about which language is selected, that only applies to the code snippet (which we won't use).
