We now have everything we need on the Rails server to send both iOS and Android notifications. Next, we'll connect our Android app to the Firebase project and add the dependencies needed to receive notifications.

Add FCM Dependencies

Back in the Firebase Console, click the General tab at the top and scroll down. Click the google-services.json link to download the JSON file to your machine. Copy it over to **android/app**.

Our Firebase project is now connected with our Android app. Next up is configuring the Android app to receive notifications.

Open Android Studio and add the Google Services plugin and Firebase dependencies to the app's **build.gradle.kts**.

ch10_51/android/app/build.gradle.kts

```
    plugins {
        alias(libs.plugins.android.application)
        alias(libs.plugins.kotlin.android)
        alias(libs.plugins.compose.compiler)
        id("com.google.android.libraries.mapsplatform.secrets-gradle-plugin")
        id("org.jetbrains.kotlin.plugin.serialization")
»       id("com.google.gms.google-services")
```
