```
        suspend fun registerToken(token: String) = withContext(Dispatchers.IO) {
            val url = URL("$baseURL/notification_tokens")

            val connection = url.openConnection() as HttpURLConnection
            connection.requestMethod = "POST"
            connection.setRequestProperty("Content-Type", "application/json")

»           CookieManager.getInstance().getCookie(baseURL)?.let {
»               connection.setRequestProperty("Cookie", it)
»           }
        }
    }
```

Next, add the notification token payload as JSON to the request.
