```
        private fun initializeBottomTabs() {
            // ...
        }

»       override fun onStart() {
»           super.onStart()
»
»           handleDeepLink(intent)
»       }

»       private fun handleDeepLink(intent: Intent?) {
»       }
    }
```

Extract the `path` as a `String` and build a URL via `baseURL`. Then pass this to the current `Navigator`. Wrap up the function by setting the `Intent` to `null`, to make sure we don't route the same notification again on the next app launch.

ch10_67/android/app/src/main/java/com/masilotti/hikingjournal/activities/MainActivity.kt

```
    // ...

    class MainActivity : HotwireActivity() {
        // ...

        private fun handleDeepLink(intent: Intent?) {
»           val path = intent?.getStringExtra("path")
»           path?.let {
»               delegate.currentNavigator?.route("$baseURL$it")
»           }
»           this.intent = null
        }
    }
```

This function will be called every time the app launches, even when there isn't a notification to route. That's why we need to make sure there is a `path` extra in the `Intent` with the optional unwrapping.
