What's Next?

Congratulations, you've completed *Hotwire Native for Rails Developers*!

You now know how to build iOS and Android apps powered by your Rails server. You understand the Hotwire Native mindset of leaving as much logic as possible on the server. And you know how to progressively enhance the app with bridge components and fully native screens. You are well on your way to creating sustainable, low-maintenance mobile apps that your users will love.

The beauty of the techniques you've learned is that you can apply them to *any* native API. Need some data from HealthKit?[91] Build a new bridge component and grab the data in `onReceive(message:)`. What about a fully native home screen? Follow the steps from Chapter 5, *Render Native Screens with SwiftUI*, and Chapter 6, *Render Native Screens with Jetpack Compose*, replacing everything related to a map with your domain.

If you're looking for inspiration on what to build next, check out the Hotwire Native directory,[92] a community-run website listing apps available for download in the app stores. Some are even open source. For more details on iOS and Android development, Apple's iOS Developer Documentation[93] and Google's Android Developer Guides[94] are great places to go deeper with native capabilities.

To stay up-to-date on the latest Hotwire Native releases and techniques, visit my website at masilotti.com.[95] I post weekly-ish, covering tips and techniques for efficiently building mobile apps with ease. I also share some behind-the-scenes previews of what I'm currently working on.

Finally, if you need help with *your* app, please don't hesitate to reach out. I've helped dozens of businesses launch their Hotwire Native apps and consulted for twice as many. I can do the coding myself, advise as your team builds, or level up your developers with private training. Send me an email at https://joe@masilotti.com; I'd love to hear from you!
