The question mark after `window` is similar to the Safe Navigation Operator in Ruby (`&`). We can chain calls with the question mark to safely work with optionals. If the underlying value is `nil`, then nothing happens—just like in Ruby.

When the app launches, it will now render the navigator's screen hierarchy.

Initiate the Visit

Next, tell `Navigator` to visit the hikes index page by calling `start()`.

ch01_09/ios/HikingJournal/SceneDelegate.swift

```
    import HotwireNative
    import UIKit

    let baseURL = URL(string: "http://localhost:3000")!

    class SceneDelegate: UIResponder, UIWindowSceneDelegate {
        // ...

        func scene(
            _ scene: UIScene,
            willConnectTo session: UISceneSession,
            options connectionOptions: UIScene.ConnectionOptions
        ) {
            window?.rootViewController = navigator.rootViewController
»           navigator.start()
        }
    }
```

Click Product → Run or press ⌘ R to build and run the app. The homepage of the Rails app will appear in the simulator.
