

Sign in by opening the hamburger menu at the top of the screen and tapping Sign in. The form is populated with credentials for the demo account, so just tap the submit button to authenticate. Once signed in, add a hike via the "Add a hike" button at the bottom of the screen.

We didn't build *any* of this functionality into the iOS app. We get it all for free from Hotwire Native, rendering our Rails HTML content. Amazing!

You Just Built an iOS App!

Congratulations! You've officially built your first Hotwire Native app on iOS. You learned how to create a new Xcode project, build a basic iOS app, and navigate to a page with `Navigator`. You even picked up some Swift along the way, like optionals, unwrapping, and protocols.

The app is off to a great start, but there are a few rough edges, especially around viewing and submitting the forms to add and update hikes. We'll explore different ways of handling forms with *modals* in Chapter 3, *Navigate Gracefully with Path Configuration*.

But for now, let's switch gears to Android. Feel free to skip this part if you only want to focus on iOS. You can always come back later for the Android details.
