```
junitVersion = "1.2.1"
espressoCore = "3.6.1"
appcompat = "1.7.0"
material = "1.12.0"
activity = "1.10.1"
constraintlayout = "2.2.1"

# ...
```

If you changed anything, then Android Studio will complain that Gradle files have changed and the project needs to be synchronized. Resolve this by clicking the Sync Now button in the yellow bar at the top of the screen.

When synced, run the app by clicking the green arrow at the top of the screen or by clicking Run → Run ‘app’. Your first Android app. Nice work!

Before we add the Hotwire Native dependency, I want to share two personal IDE preferences I configure in Android Studio: light mode and detached emulators. Feel free to skip ahead if you aren’t interested in either of these.

Configure Android Studio (Optional)

Enable light mode by clicking Android Studio → Settings…. Select Appearance from the Appearance & Behavior category on the left. Then change the Theme option from Dark to Light with Light Header.
