Add the Hotwire Native Dependency

Like the Swift package on iOS, Hotwire Native is added to the Android app as a Gradle dependency. Scroll to the bottom of the *app* `build.gradle.kts` (the *second* one) and add the Hotwire Native dependency to the `dependencies` section:

ch01_12/android/app/build.gradle.kts

```
    // ...

    dependencies {
        implementation(libs.androidx.core.ktx)
        implementation(libs.androidx.appcompat)
        implementation(libs.material)
        implementation(libs.androidx.activity)
        implementation(libs.androidx.constraintlayout)
»       implementation("dev.hotwire:core:1.2.0")
»       implementation("dev.hotwire:navigation-fragments:1.2.0")
        testImplementation(libs.junit)
        androidTestImplementation(libs.androidx.junit)
        androidTestImplementation(libs.androidx.espresso.core)
    }
```

Sync Gradle again to make the Hotwire Native library available to your codebase. Like on iOS, the next step is to get the Android app running so we can see our Rails content on the screen.
