

As you did with `SceneDelegate` on iOS, delete the contents of `MainActivity`. You'll build the entire thing from scratch.

Start by declaring an empty `MainActivity` class:

ch01_14/android/app/src/main/java/com/masilotti/hikingjournal/MainActivity.kt

```
class MainActivity {
}
```

Then, make the activity inherit from `HotwireActivity`. As you're typing this class, press Enter to let Android Studio autocomplete it for you. That will automatically import the required class at the top of the file.

ch01_15/android/app/src/main/java/com/masilotti/hikingjournal/MainActivity.kt

```
import dev.hotwire.navigation.activities.HotwireActivity

class MainActivity : HotwireActivity() {
}
```

Note the open and closed parentheses after `HotwireActivity`. This is called a *constructor invocation*, as it creates an instance of the superclass `HotwireActivity`. We could pass in different parameters here if needed.

Add an `onCreate()` function with the `override` keyword. This overrides a function from the same name as the parent class. `onCreate()` allows you to
