```
»           enableEdgeToEdge()
            setContentView(R.layout.activity_main)
»           findViewById<View>(R.id.main).applyDefaultImeWindowInsets()
        }
    }
```

The view is now configured. Upon launching, the app will attempt to render the Hotwire Native fragment `SessionNavHostFragment`, declared earlier in `activity_main.xml`. The last step in this file is to configure Hotwire Native.

Configure a Hotwire Native Navigator

`HotwireActivity` requires an additional member to be implemented, hence the red squiggle under `class MainActivity`, indicating an error.

Move your cursor over the squiggle and press ⌥ ↩ to open the context menu. Click “Implement members” and then OK from the next dialog. Android Studio will add a placeholder implementation of the required function, as shown in the screenshot.
