Now add a new HTML element to the code that powers this page, app/views/hikes/index.html.erb, like so:

ch02_01/rails/app/views/hikes/index.html.erb

```
    <%= render "shared/header", title: "Hikes" %>

» <div class="container">
»   <div class="alert alert-primary" role="alert">
»     New content added from the Rails codebase.
»   </div>
» </div>

    <%# ... %>
```

Refresh the page in the browser to see the updated content. Boring, right? That's what's expected of websites! But now for the magic…

Back in the iOS simulator, click and drag the mouse from near the top of the screen down toward the bottom. You'll see a little spinner start filling in at the top. Once it fills, let go, and the page will refresh. And there's the content you added to the server!
