Hide the Navigation Bar with CSS

Bootstrap uses responsive breakpoints[22] to conditionally apply styles to different screen sizes. For example, applying the `d-none` class to an element hides it on all devices by setting the `display` property to `none`. And throwing `md`, the keyword for medium, in between creates `d-md-none`. Applying this class hides the element only on screen sizes of size medium or larger.

You can follow this guidance to create a similar class for Hotwire Native apps: `d-hotwire-native-none`.

First, remove the `hotwire_native_app?` conditional and add the new nav class `d-hotwire-native-none`:

ch02_06/rails/app/views/shared/_navbar.html.erb

```
» <nav class="navbar d-hotwire-native-none bg-body-tertiary">
    <div class="container">
      <%# ... %>
    </div>
» </nav>
```

Next, create a new CSS file in `app/assets/stylesheets` and name it `native.css`. Add the new CSS class `d-hotwire-native-none` here to hide content:

ch02_07/rails/app/assets/stylesheets/native.css

```
.d-hotwire-native-none {
  display: none !important;
}
```

You only want to include these CSS overrides for Hotwire Native apps. Using the `hotwire_native_app?` helper from earlier, you can link to the stylesheet to do exactly that! Update the application layout as follows to conditionally link to the native stylesheet:
