ch02_08/rails/app/views/layouts/application.html.erb

```
<!DOCTYPE html>
<html>
  <head>
    <%# ... %>

    <%= stylesheet_link_tag "application", "data-turbo-track": "reload" %>
»   <% if hotwire_native_app? %>
»     <%= stylesheet_link_tag "native", "data-turbo-track": "reload" %>
»   <% end %>

    <%# ... %>
  </head>

  <body>
    <%# ... %>
  </body>
</html>
```

You now have a place to put all of your conditional CSS that *augments* your native apps—the new stylesheet. It can override existing styles or add new ones like you just did. And the best part? You no longer need to submit a new version of your app to make style changes. You can simply update `native.css` as if it were any other stylesheet, and your app gets the updates immediately.

Before we move on to discuss how to accomplish this with other CSS frameworks, let's first address the double title problem in the apps.

Hide the `<h1>`

Your apps currently show two Forest Park titles and two Hikes titles. Each screen now renders this page title in the native navigation bar *and* in the `<h1>` tag right after it, as shown in the screenshot.
