```
»       addVariant("hotwire-native",
»         "html[data-hotwire-native-app] &"),
»       addVariant("not-hotwire-native",
»         "html:not([data-hotwire-native-app]) &")
»     },
    ],
  }
```

You can now prefix any Tailwind CSS class with `hotwire-native:` to only apply that style to Hotwire Native apps. And you can use `not-hotwire-native:` to apply a style to everything *but* Hotwire Native apps:

```
<div class="bg-white hotwire-native:bg-black">
  White background on web, black on Hotwire Native apps.
</div>

<div class="text-black not-hotwire-native:text-white">
  Black text on Hotwire Native apps, white text on web.
</div>
```

Remember that this note was only an example; the Rails app we're working with doesn't have Tailwind CSS installed.
