Access the Camera and Photos on Android

Just like on iOS, you don’t need to do anything to access the user’s camera or photo library on Android! Everything will work out of the box with the `<input type="file"/>` tag from the server.

Tapping the Choose File button when editing a hike presents a user with the option to choose between the camera or the photo library.

And tapping the Camera option in the emulator gives you a cute little dancing robot. Look at them go!
