What’s Next?

Your apps are really coming together. In this chapter, you’ve learned different ways to drive content and behavior directly from the server. You dynamically set the native title via HTML, hid the navigation bar with CSS, accessed the user’s photo library, and more.

These apps technically work—you can navigate between screens, sign in and out, and even add new hikes. But there are a few rough edges, especially around workflows dealing with submitting forms. In the next chapter, you’ll learn how to improve the form UX via the path configuration to make the apps feel a bit more native.
