if the new screen should be presented as a modal or not.

Add a rule to present all forms as modals, like so:

ch03_04/rails/app/controllers/configurations_controller.rb

```
    class ConfigurationsController < ApplicationController
      def ios_v1
        render json: {
          settings: {},
          rules: [
»           {
»             patterns: [
»               "/new$",
»               "/edit$"
»             ],
»             properties: {
»               context: "modal"
»             }
»           }
          ]
        }
      end
    end
```

By convention, forms in Rails end in `/new` or `/edit`, which can be mapped as a `pattern` to a regex with a trailing dollar sign, which indicates the end of a string.

Now, every time a page is visited where the URL path ends in `/new` or `/edit`, the `context` property will be set to `"modal"`. And under the hood, Hotwire Native is aware of this special property and will present the screen as a modal.

The benefit of using remote path configuration is that you can change the `patterns` key without releasing a new version of the app. For example, let's say you want to display a brand-new user profile screen as a modal. Simply
